

Abstract

In a razor cartridge, a housing is provided having first and second razor blade assemblies positioned therein. The first and second razor blade assemblies each include at least one razor blade and an at least partially exposed cutting edge. The razor blades are positioned in the first and second blade assemblies to allow hair to be cut from a user's skin when the razor cartridge is drawn thereover in either of two generally opposite cutting directions. At least one shaving aid outlet is defined by the razor cartridge and positioned between the first and second razor blade assemblies to allow the shaving aid to be dispensed therethrough.
